Make a directory

- If you want to create a directory, then you use mkdir command as follows

  mkdir directoryname

- You can create more than one directory as follows

  mkdir directory1 directory2 directory3

  This will create three directories

- mkdir stands for make directory

- As you can see, Linux command names are logical. And that's why they are so easy to remember

<u>Remove an empty directory</u>

- Now if you want to delete an empty directory

  (For example, directory1)

  Then you use rmdir command as follows

  rmdir directory1

  This will only remove directory1 if it's empty !

- You can also remove more than one empty directory at once. (For example, directory1 directory2 directory3)

  rmdir directory1 directory2 directory3

  This will only remove directory1, directory2 and directory3 if they are all empty .

  However, if directory1 and directory2 are non empty and directory3 is empty. Then the above command will only delete directory3 and so on.

- Basically, It just deletes the empty directories.

- rmdir stands for remove directory
